ISUCON11 qualifier: measured efficiency over one 180-minute rerun

One simultaneous trial per arm · score updates use eligible benchmark completion times · token events use recorded timestamps

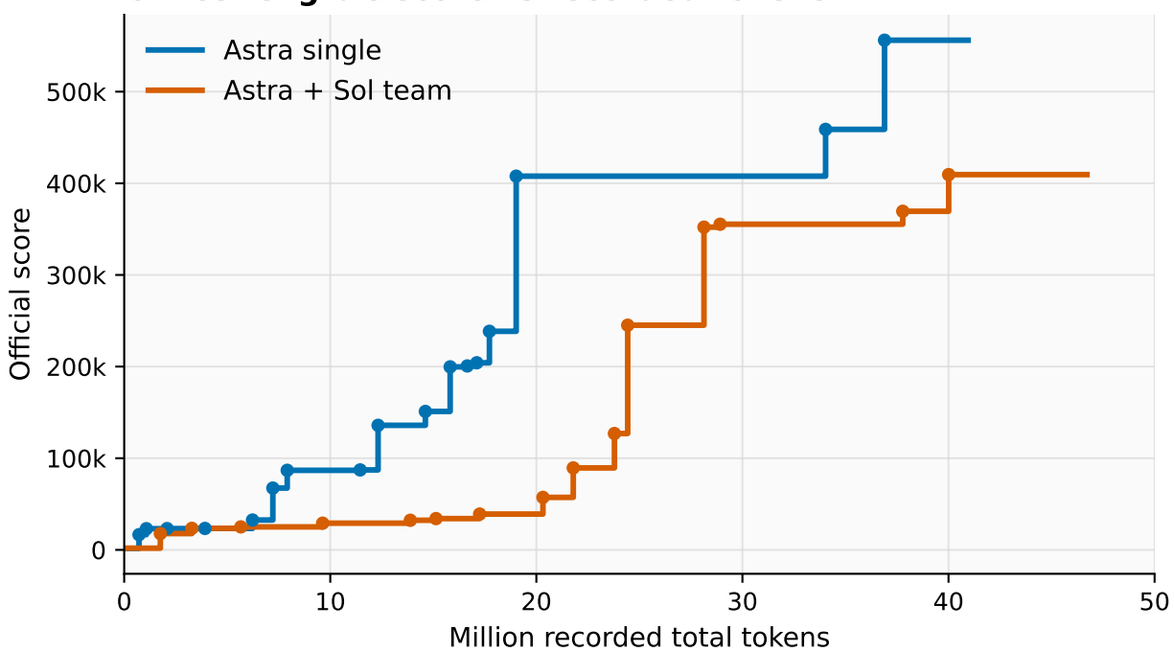

A Best eligible score vs elapsed time

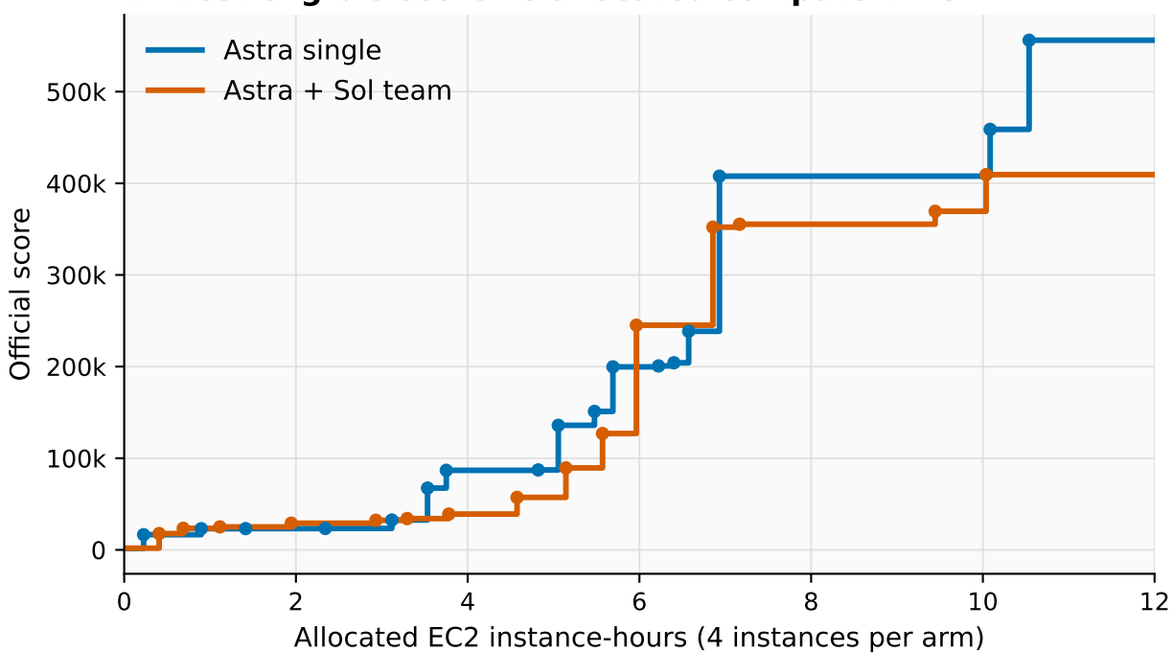

B Recorded cumulative total tokens vs time

C Best eligible score vs recorded tokens

D Best eligible score vs allocated compute time

Recorded total tokens include cached input once. Multi combines the root and 29 child threads; resumed threads are not added twice.
Both root final turns were interrupted, so token totals are observed lower bounds. Monetary cost: unavailable; no USD estimate.
Panel D is allocated resource time only; it rescales elapsed time because both arms used four instances.
